

**nFinity® Cloud vs In-House IT**

| nFinity® Cloud   | In-House IT   |
|--|---|
| All servers deployed and immediately ready to support your IT initiative                                     | Deploying servers is time-consuming and difficult, particularly if you don't do it on a daily basis                                   |
| Allows you to implement new IT solutions without Cap-Ex funding requests                                     | Obtaining the necessary capital to invest in the server infrastructure can be as challenging as deploying the new solution            |
| Ongoing costs are predefined and easy to budget  | The continuing cost of maintaining and managing the server infrastructure increases over its lifetime                                 |
| 100% SLA guaranteed uptime   | There are many factors internal IT groups need to manage to meet similar service levels   |
| Eliminates IT drudge work  | IT can get mired in tasks that focus on supporting hardware instead of company goals  |
| Supported by a complete team of server management experts, 24/7/365  | It is costly to employ an IT staff that provides 24/7/365 support   |
| Virtual platform provides professionally managed data backup   | Managing data backup requires human resources, special equipment and a costly off-site location                                       |
| In case of a disaster, you can still access your data and applications via the internet                      | Without a well defined business continuity plan, most businesses won't survive a disaster simply because they can't access their data |
| Your servers – critical, private, important – are safely stored in our SAS 70, Type II certified data center | Highly secure IT storage facilities are costly to deploy and maintain   |
| Supports green IT initiatives as it allows for efficient use of systems and the energy needed to run them    | Companies can spend more to power and cool a server than they spent to purchase it  |
